U.S. Patent No. 8,213,975: Foursquare

Claim 44	Analysis	Select Evidence
A method comprising:	Foursquare provides a mobile software application that directs mobile devices to practice the infringing method.	
receiving data on the location of wireless handheld devices that was generated through the use of localization circuitry through the use of a wireless network;	The Foursquare mobile application receives a user's location data that was generated using A-GPS circuitry on smartphone devices. A-GPS (Assisted GPS) is used by smartphones to decrease processing and memory costs associated with locating GPS satellites by utilizing GPS data from wireless network providers, such as cellular carriers. Smartphones use A-GPS localization circuitry to determine the location of a device. A-GPS utilizes data through the use of a wireless network provided by cellular carriers.	Except as discussed below, whenever you open and interact with the foursquare app on your mobile device, we use the location information from your mobile device to tailor the foursquare experience to your current location (i.e. we'll show you a list of nearby venues, friends and Tips). Source: http://support.foursquare.com/entries/239855-does-foursquare-track-my-location The current time can also be used as a clue. With a precise current time, fragmentary satellite data can be decoded to gain a faster lock or figure out the appropriate information to use. In CDMA networks, such as that used by Verizon, GPS-synchronized atomic time is required for the network's basic operations, making it a simple matter to have such information available. (In fact, CDMA cell towers have GPS units built in to maintain better atomic time synchronization.) These extras are what makes GPS into AGPS. Though a lot of people misunderstand AGPS and think it's some faux GPS system, that's not the case: AGPS requires a GPS receiver to work. Apple's iPhone and 3G iPad models include AGPS, as do nearty all competing devices with GPS allows the use of much cheaper and simpler GPS circuits in phones, reducing cost and battery drain.) This is where Apple's statement on Wednesday deviates from full accuracy. Apple uses AGPS for native GPS-lock improvements, and Wi-Fi network and cell tower locations are additional factors in providing a fast initial connection along with improving GPS accuracy. Cellular carriers have extremely precise GPS measurements of the signal strength of those within range—which may be dozens—and trialterate to find an area that overlaps among them. (Criateration involves overlapping regions to find an intersecting area; triangulation uses the measurement of angles to find a center point.) Claim 44	Analysis	Select Evidence
determining whether said handheld devices are within or in the immediate vicinity of a venue;	Foursquare determines whether or not a user is within or in the immediate vicinity of a venue before allowing the user to "Check In" for points or mayorships.	What we'd like to do is award points, mayorships and badges only when you're at the place you say you're at. Last week we started using a few different tricks using your phone's GPS to try to verify this. (and if your phone doesn't use GPS, we use a few different tricks) Source: http://blog.foursquare.com/2010/04/07/503822143/ and badges. Now, you may check in anywhere, but in order to receive points, mayorships and badges your GPS must report that you're within approximately 200-250 meters* of the venue's map pin location (among other factors that Foursquare doesn't disclose). If you're outside of that radius, Foursquare reports that your phone thinks you're "a little too far away" from the venue. Source: http://aboutfoursquare.com/too-far-away/
transmitting information for directing the wireless handheld device to prompt the user of the handheld device to enter a response;	When a user is within the vicinity of a venue, the Foursquare application will allow the handheld device to display the "Check In Here" prompt.	Places foursquare Share Yankee Stadium 1 E 161st Street (River Ave) Check In Here 25 PEOPLE HERE (17 FRIENDS) TIP Oakland Athletics vs. New York Yankees 19 TIPS Source: http://blog.foursquare.com/2011/08/18/foursquare_events/

Claim 44	Analysis	Select Evidence
processing the feedback into results, which are provided to a sponsor.	Foursquare servers process the Check-In information, determine the users who have checked in the most during the past 60 days (highest number being declared the Mayor), and provide this information to a sponsor, such as a business owner. As shown to the right, Foursquare provides sponsors with the results of processing user checkins on a sponsor's "Foursquare Analytics Dashboard."	Foursquare mayorships are awarded to your customers with the most days checked into your venue over the last 80 days, and only users who have uploaded profile photos are eligible. The mayor will always be visible on your foursquare venue page as well as on all the mobile clients (good for special venification/redemption). This title is up for grabs for customers that visit you often, but is not achievable by employees, owners, or managers. You can provide rewards to those crowned in the specials management section, once your venue has been claimed.
